National University of Singapore School of Computing CS1010X: Programming Methodology Semester II, 2024/2025

Recitation 9 Object-Oriented Programming

Problems

- 1. Write a Food class
 - Input properties is the name, nutrition value, and good_until time.
 - Additional property is the age of the food, initially 0.
 - Methods are:
 - sit_there takes an amount of time, and increases the age of the food by the amount.
 - eat return the nutrition if the food is still good; 0 otherwise.

2. Write an AgedFood class

- Input property is the same as the Food class, with an additional property, which is the good_after time.
- Should inherit from the Food class.
- Methods are:
 - sniff returns True if it has aged enough to be good, False otherwise.
 - eat returns 0 if the food is not good yet; otherwise behaves like normal food.

- 3. Write a VendingMachine class
 - Input property is the same as the Food class.
 - Additional property is age of the VendingMachine, initially 0.
 - Methods are:
 - sit_there takes an amount of time, and increases the age of the vending-machine by *half* that amount (it's refridgerated!).
 - sell_food returns a new food instance with the appropriate name, nutrition and good_until.

4. Write mapn, which allows an arbitrary number of input lists¹, for example:

fn is the function that you would apply to the lsts

```
((1, 2, 3), (4, 5, 6), ('first', 'second', 'third')))
#Output: (('first', 5), ('second', 7), ('third', 9))
The function definition should look like this:
def mapn(fn, 1sts)
```

lsts is the list of lists that would given as input to the function fn

You may use the regular map in your implementation.

mapn(lambda x, y, z: (z, x+y),

5. **Homework:** How would you implement the vending machine so that it can sell both Food and AgedFood (and possibly other things too?).

¹It turns out that the regular map is pretty similar to the mapn you will write here!
